# A Study of Health Wearable User Archetypes

Exploratory

Anker Innovations

Sole UXR

2025

# Study Overview

## The Challenge

Health Team  
formed early 2025.

No user or product  
clarity.

## The Problem

30+ stakeholders  
need a shared map.

## The Solution

10 IDIs ;  
Standardized  
Scoring & JTBD  
Framework

Sole UXR designed  
and executed the  
study.

## Timeline

10 Weeks

Apr. - Jun. 2025

## Results

60+ comments  
brainstorming  
product ideas

Made onboarding  
materials

User interview  
workshop

## Impacts

2 target user  
archetypes

v1 product direction

Research credibility  
& Follow-up studies

# A Study of Health Wearable User Archetypes

## The Challenge:

The Health Team lacked a shared understanding of the v1 product's value proposition.

## The Objectives:

- To understand health wearable users' mental models, monitoring needs, and health management routines
- To identify user archetypes and opportunities for the first product

## Key questions

- User archetypes for health wearable users?
- Unmet needs?
- Value proposition to fill the gaps?

# Research Plan

## Participant

10 Health wearable users (> 1 yr) with chronic diseases (> 1 yr)

- hypertension
- obesity
- cardiovascular disease
- sleep apnea

## Recruitment

Internal user panel

## Timeline

10 weeks

Apr. - Jun. 2025

## Methodology

Literature Review

90 min 1-1 IDs

## Data Analysis

**Two-stage:**  
1/ User archetypes by standardized scoring

2/  
Jobs-to-be-done Framework

## Report Share-out

30+ stakeholders (PMs, Designs, Engineers)

# Timeline

# Research Plan

## Participant

10 Health wearable users (> 1 yr) with chronic diseases (> 1 yr)

- hypertension
- obesity
- cardiovascular disease
- sleep apnea

## Recruitment

Internal user panel

## Timeline

10 weeks

Apr. - Jun. 2025

## Methodology

Literature Review

90 min 1-1 IDs

## Data Analysis

**Two-stage:**  
1/ Standardized Scoring

2/ JTBD Framework

## Report Share-out

30+ stakeholders (PMs, Designs, Engineers)

# User archetypes by standardized scoring

Step 1

## Raw Interview Data

From 10 transcripts

Step 2

## Standardized Scoring

Answers to non-product related questions:  
*Do you consider yourself proactive or reactive when managing your health?*  
*Why?*

1 - Reactive    5 - Proactive

Step 3

## High-level Factors

Factor 1: Condition Severity, Management Burden

Factor 2: Proactiveness, Mindset, Tech Fluency, Device Ecosystem, Data Interaction

# Results: Four User Archetypes\*

- **The Data-Driven Co-Manager** (High Complexity/High Engagement)
- **The Health Optimizer** (Low Complexity/High Engagement)
- **The Passive Patient** (Low Complexity/Low Engagement)
- **The Overwhelmed Reactor** (High Complexity/Low Engagement)
- Job Statement - Feature(s) used - Ideal outcomes - unmet needs

\* Data points redacted for portfolio use.

# From Archetypes to Strategic Prioritization

- Target user archetypes & Product form
- Key metrics for some chronic diseases

# Report share-out: Aligned Product, Design, and Engineer with a shared map

**30+**

Attendees (including  
Leadership)

**60+**

Comments in the report  
document

**Real-time**

Brainstorming of concepts  
and features

**Must-read**

For new Health Team  
members joining post June  
2025.

# Impacts: Target User Archetypes, Research Credibility, & Research Education

01

## Target User Archetypes

First target user map

Guided the v1 product's direction

02

## Research Credibility

### **Follow-up studies:**

Quantitative Validation Study;  
Feature Prioritization Study

### **Full-cycle integration:**

Value Proposition, Industrial  
Design Testing, Concept  
Testing

03

## Research Education

**Led a workshop** on interview  
and data analysis skills

**Developed an internal online  
class** based on the workshop  
content

# When recruiting for exploratory studies, prioritize **user experience patterns** over specific product ownership.

## **The Setback:**

Study duration expanded from 10 weeks to 12 weeks.

## **Reasons:**

Overly strict recruitment criteria for:

- 1/ a product with a less than 2% incidence rate
- 2/ a small user pool with unknown response rate

## **If I could do it again:**

- Emphasize risks of delay when recruiting from a new user panel.
- Prioritize user experience patterns (health wearables) over specific product ownership (ring).

## **US Market Incidence Rate (Data from 2024)**

# From Prototype to Product: A Multi-Agent System Usability Study

Evaluative

Anker Innovations

Builder & Sole UXR

2025

# Study Overview

## The Challenge

In Dec. 2025, I built a five-step Research Agent prototype in an AI-Hackathon.

Unsure about PMs' mental models for using the Agent.

## The Problem

Identify major usability issues before beta launch.

## The Solution

1:1 usability study with 6 Senior PMs.

Sole UXR initiated, designed, and executed the study.

## Timeline

1 Week

Dec. 2025

## Results

Turned a prototype into a viable workflow tool by surfacing design & engineering bugs.

**Design:** Control & Transparency

**Engineering:** Latency & Instruction Adherence

## Impacts

**A confident beta launch** for the first Research Agent.

**High adoption rate:** 32% of PMs used the Agent within 30 days of launch.

# The Research Agent

## (The Five-step Workflow)

# Research Plan

## Participant

6 Senior product managers with real-life user interview experience

## Recruitment

Announcements & Group chats

## Timeline

1 Week  
Dec. 2025

## Methodology

60 min 1:1 usability study with 5 tasks  
  
Replicate a study they did before

## Data Analysis

Problem statement analysis

## Study Share-out

A one-pager shared with my partner Engineer

# Design: Lack of Control

## The Problem:

Users felt sidelined during interview, causing a lack of accountability.

### Stage 4: The Interview Agent

**Problem Breakdown:** The design was passive. Users could not interrupt, redirect the conversation or ask follow-up questions.

## The Fix:

Convert the user from 'Viewer' to 'Director'.

### Feature: Interactive Mode

**How it works:** Allows PMs to pause the interview and ask a follow-up question or redirect the conversation.

# Design: Lack of Transparency

## The Problem:

Users felt unsafe to base product decisions on unverifiable insights.

### Stage 5: The Insight Agent

**Problem Breakdown:** The Agent presents the insight report without referencing the raw interview data.

## The Fix:

Establishing trust through traceability.

### Feature: Source-Labeling

**How it works:** Footnotes added to every claim in the summary. Clicking the source shows the verbatim quote in the transcript.

# Impacts:

01

## Confident Beta Launch

Turned an experimental prototype to a viable workflow tool.

First Research Agent in the company.

02

## High Adoption Rate

Within 30 days of launch, 32% of PMs (N=160+) used the Agent. The total use count is over 500.

Junior PMs think it's helpful. Senior PMs look forward to better report quality.

# Prompt Engineering Problems

- **Latency**
  - Slow responses
  - Too many rounds of conversation
- **Instruction Adherence**
  - Ask completely irrelevant questions
  - Omit instructions in the system prompt
  - Ask the questions that a user asked before back to the user
  - ...

# Agentic Experience Evaluation: Real-life Scenarios are better than hypothetical tasks.

Hypothetical tasks create a layer of uncertainty, whereas tasks replicating real-life scenarios free expert users from using their imagination and provide objective feedback on agent performance.

**Q & A**
